

WEB-PAGE PROCESSING METHOD FOR REDUCING LOAD OF SERVER

ABSTRACT OF THE DISCLOSURE

A web-page processing method, at the data write-in stage, converts a web page into web-page data to be stored in a database in a specified format, and parses the web-page data to locate a portion of contents associated with the server-side command(s). Further, the storage information of said portion of contents in the database is recorded as index data. At the run-time stage, the portion of contents associated with the server-side command(s) is outputted to the server when the index data is referred to in response to a read command of the server. Then, the server-side command(s) is executed by the server and outputted to the browser of the client's side.
